

Industrial strength middleware for Real-Time Data

DataBridge

DataBridge - Deployed Industrial strength middleware solution for Real-Time market data. DataBridge is a software package that facilitates bulk transfer of real-time financial information in the form of data messages from one system to another. DataBridge accepts data from any Reuters Triarch (SSL 4.0) source and allows the operator to manipulate and create data messages. It then transmits the messages either in real-time, delayed, scheduled or snapshot mode, to an output destination. The output destination could be serial data stream, ASCII file, XML, HTML, TCP/IP, or customised output solutions e.g., IBM DataQueue, ODBC/Oracle database, Host Integration Server/VSAM. DataBridge, a 32 bit software package designed for Windows 9x/NT/2000, is the result of over 8 man years of development by Exsys in co-operation with Reuters.
